List of Tables

Table 1: Landslide predictor variables evaluated for the susceptibility analysis, themes according to Reichenbach et al. (2018) 16
Table 2: Validation of the susceptibility models using a 10-fold cross validation procedure 18
Table 3: Areas per landslide susceptibility class per site 21
Table 4: Sub-catchment average values of landslide susceptibility 21
Table 5: Sub-catchment average values of landslide frequency (mean landslide frequency and mean landslide affected area) 21
Table 6: Landslide hazard categories 25
Table 7: Areas per landslide hazard rate class per site 26
Table 8: Landslide exposure database for the current land use situation as per 2018 land use plans 28
Table 9: Landslide exposure database for the projected land use masterplan 2050 29
Table 10: Variance inflation factor for the continuous variables used in the landslide susceptibility model 37
Table 11: Condition Indices (CIs), calculated for the continuous variables used in the landslide susceptibility model 38
Table 12: General classification of mitigation measures (SafeLand, 2012) 43
Table 13: Triggering factors with examples of common causative/forcing processes. Adapted from Leroueil (2001) and Lu and Godt (2013) 46
Table 14: Landslide Hazard Mitigation Measures (adapted from Popescu & Sasahara, 2009) 48
Table 15: Surface areas under the two highest landslide hazard classes 57
Table 16: Existing land use in areas with the highest susceptibility to landslides 58
Table 17: CROM matrix of slope / soil depth classes and alternative land use options 59
Table 18: Summary of proposed mitigation measures 60

List of Figures

Figure 1: Landslide risk assessment methodology..... 7
Figure 2: Examples of landslides and other slope processes inventoried from Google Earth 12
Figure 3: Landslide and knickpoint inventory for Rwanda (from Depicker et al., 2020a) 15
Figure 4: Variable importance in the logistic regression model 19
Figure 5: Landslide susceptibility in the four study areas (purple and blue areas are inventoried landslides)..... 20
Figure 6: Relationship between landslide susceptibility and landslide affected area (i.e. landslide rate) ... 23
Figure 7: A) Probability density. B) Probability density weighted for landslide rates (i.e. affected area) 24
Figure 8: Landslide hazard maps (purple and blue areas are inventoried landslides) 25
Figure 9: Comparative analysis impacted land use categories – current and projected land use plans 30
Figure 10: Framework for landslide risk management. Adapted from Fell et al. (2008) 40
Figure 11: A) Relative root strength following tree removal. Depending on tree species and site characteristics, the period of highest susceptibility for shallow landslides is between 3 to 15–20 after timber harvest; however, a rainfall event is still required to initiate a landslide, but with a lower threshold. Once regenerating tree roots fully establish, the risk of shallow landslides returns to pre-harvest conditions. Source: Sidle and Bogaard, 2016. B) Road effects on slope stability and drainage. Source: Sidle and Ochiai, 2006. C) Urban and residential influences on slope stability. Source: Sidle and Ochiai, 2006 42
Figure 12: Stability states and destabilising factors. Adapted from Glade and Crozier (2005). Landslides occur when the factor of safety 46
Figure 13: Stability Schematic demonstrating the possible forcings of landslides..... 47
